

## **LISTING OF CLAIMS**

This "Listing of Claims" will replace all prior versions and Listings of Claims in this patent application.

1. (Currently Amended) A system for supporting a factory built building, said system comprising:

a footing having an elongated channel extending in a direction that is substantially parallel to a longitudinal axis of said footing, wherein said longitudinal axis of said footing is equally spaced from first and second outer sidewalls of said footing, and wherein a longitudinal axis of said channel is spaced closer to said first outer sidewall than to said second outer sidewall;

a support stand including a plurality of support members and a base, said plurality of support members that define said support stand each extend in a common vertical plane;

a skirting panel positioned within said elongated channel of said footing; and

a passage for receiving an anchoring rod, said passage extending through a portion of said footing from an outer surface of one of said sidewalls to the base of said footing.

2. (Original) The system of claim 1 wherein said base includes a first portion that extends within said channel of said footing, said first portion of said base being positioned between said skirting panel and a sidewall of the channel.

3. (Previously Presented) The system of claim 1 wherein the longitudinal axis of the elongated channel is substantially parallel to and offset from the longitudinal axis of said footing such that the longitudinal axis of said channel is spaced from said longitudinal axis of said footing.

4. (Original) The system of claim 1 wherein said channel comprises a base and first and second sidewalls extending upwardly away from said base of said channel, said sidewalls extending from said base of said channel such that said first sidewall is free of being parallel with said

second sidewall.

5. (Original) The system of claim 1 wherein said footing further comprises a slot extending within said footing, said slot has a longitudinal axis that extends at an angle to the longitudinal axis of said channel.

6. (Cancelled).

7. (Cancelled).

8. (Previously Presented) The system of claim 1 wherein said passage has an opening extending along an outer surface of said first outer sidewall and an opening extending along said base of said footing.

9. (Original) The system of claim 1 wherein at least one of said ends of said footing has a substantially trapezoidal shaped cross section.

10. (Original) The system of claim 1 wherein said base of said support stand includes a first elongated portion positioned within said channel and a second elongated portion extending at an angle to said first portion and outside the channel of the footing.

11. (Original) The system of claim 10 wherein said support members converge toward each other along their length in a direction away from said base.

12-14. (Cancelled)

15. (Original) The system of claim 1 wherein said support members are formed of an angle, channel or tubular shaped material.

16-19. (Cancelled).

20. (Currently Amended) A system for supporting a factory built building, said system comprising:

a footing having an elongated channel extending in a direction that is substantially parallel to a longitudinal axis of said footing, wherein said longitudinal axis of said footing is equally spaced from first and second outer sidewalls of said footing, and wherein ~~the a~~ longitudinal axis of said channel is spaced closer to said first outer sidewall than to said second outer sidewall;

a support assembly comprising a plurality of support members and a base, said base having a portion received within said channel of said footing;

a skirting panel positioned within said channel such that said portion of said base within said channel is positioned between said skirting panel and a sidewall of said channel; and

a passage for receiving an anchoring rod, said passage extending through a portion of said footing from an outer surface of one of said sidewalls to the base of said footing.

21. (Original) The system of claim 20 wherein said support assembly comprises a support stand including said support members, and wherein said support members defining said support stand extend within a common vertical plane.

22. (Previously Presented) The system of claim 20 wherein the longitudinal axis of said elongated channel is substantially parallel to and offset from the longitudinal axis of said footing.

23. (Original) The system of claim 20 wherein said channel comprises a base and a pair of sidewalls extending upwardly away from said base of said channel, said sidewalls extending from said base of said channel such that a first of said sidewalls is free of being parallel with a second of said sidewalls.

24. (Original) The system of claim 20 wherein said footing further comprises a slot extending within said footing, said slot has a longitudinal axis that extends at an angle to the longitudinal axis of said channel.

25. (Cancelled).

26. (Cancelled).

27. (Previously Presented) The system of claim 1 wherein said passage has an opening extending along an outer surface of said first outer sidewall and an opening extending along said base of said footing.

28. (Original) The system of claim 20 wherein said support members converge toward each other along their length in a direction away from said base.

29. (Currently Amended) The system of claim 20 wherein said support members include a first terminal end secured to said base of said support stand and a second terminal end secured to an apparatus that receives a member ~~for connecting~~ configured to connect said support members to the building.

30. (Currently Amended) The system of claim 29 wherein said apparatus comprises a turnbuckle and said member configured to connect ~~for connecting~~ said support members to said building includes a threaded member received within said turnbuckle.

31. (Original) The system of claim 20 wherein said support members are formed of an angle, channel or tubular shaped material.

32. (Cancelled).

33. (Cancelled).

34. (Original) The system of claim 20 wherein said support assembly includes only two support members.

35. (Original) The system of claim 20 wherein said support assembly includes only three support members.

36. (Currently Amended) A system for supporting a ~~factory-built~~ building, said system comprising:

a footing having an elongated channel extending in a direction that is substantially parallel to a longitudinal axis of said footing;

a support stand including a plurality of support members and a base, said plurality of support members that define said support stand each extend in a common vertical plane,

wherein said support members include a first terminal end secured to said base of said support stand and a second terminal end secured to an apparatus that receives a member ~~for connecting~~configured to connect said support members to the building, and

wherein said apparatus comprises a turnbuckle and said member ~~for connecting~~configured to connect said support members to said building includes a threaded member received within said turnbuckle, wherein said turnbuckle is secured between said support members; and

a skirting panel positioned within said elongated channel of said footing.

37. (Previously Presented) A system for supporting a factory built building, said system comprising:

a footing having an elongated channel extending in a direction that is substantially parallel to a longitudinal axis of said footing;

a support stand including a plurality of support members and a base, said plurality of support members that define said support stand each extend in a common vertical plane, wherein said support stand includes only two support members; and

a skirting panel positioned within said elongated channel of said footing.

38. (Previously Presented) A system for supporting a factory built building, said system comprising:

a footing having an elongated channel extending in a direction that is substantially

parallel to a longitudinal axis of said footing;

a support stand including a plurality of support members and a base, said plurality of support members that define said support stand each extend in a common vertical plane, wherein said support stand includes only three support members; and

a skirting panel positioned within said elongated channel of said footing.

39. (Previously Presented) A system for supporting a factory built building, said system comprising:

a footing having an elongated channel extending in a direction that is substantially parallel to a longitudinal axis of said footing;

a support stand including a plurality of support members and a base, said plurality of support members that define said support stand each extend in a common vertical plane, wherein said base of said support stand has a substantially L-shaped cross section, a substantially U-shaped cross section or a substantially T-shaped cross section and wherein a portion of said T-shaped base extends along said support members and is secured to at least one of said support members; and

a skirting panel positioned within said elongated channel of said footing.

40. (Previously Presented) A system for supporting a factory built building, said system comprising:

a footing having an elongated channel extending in a direction that is substantially parallel to a longitudinal axis of said footing;

a support assembly comprising a plurality of support members and a base, said base having a portion received within said channel of said footing, wherein said base of said support stand has a substantially L-shaped cross section, a substantially U-shaped cross section or a substantially T-shaped cross section and wherein a portion of said T-shaped base extends along said support members and is secured to at least one of said support members; and

a skirting panel positioned within said channel such that said portion of said base within said channel is positioned between said skirting panel and a sidewall of said channel.
